

WATER SAVER FOR TOILET

ECOSAVERS

EcoSavers® Water Saver for Toilet

The Water Saver for toilet is developed to reduce the water flow when flushing your toilet, but you are still in control if you want a quick flush or a long flush.

When you push the flush handle on your toilet tank, the flow tube inside will go up which allows the water stored in the tank to flow through your toilet (fig. 1)

The Water Saver for toilet is a weight you can hang on the flow tube inside the toilet tank. If the weight is added, the flow tube will go down again caused by the weight of the Water Saver and this will stop the flow of the water. When you want a big flush, you can easily just remain pressing the flushing handle. The flushing only stops as soon as you release the flushing handle (fig. 2)
