

KINETIC DOORBELL

ECOSAVERS

EcoSavers® Kinetic Doorbell

Do you want a wireless doorbell, but do not want to regularly buy and replace batteries?

EcoSavers has the solution: the kinetic doorbell.

The transmitter in this doorbell does not use mains power or battery. The electricity which is needed to send a radio signal to the receiver is generated by human power. The movement which is made by pushing the doorbell button is used to generate electricity; this is also called kinetic energy.

The yearly electricity costs for the receiver is very low. These costs are much lower than the standard converter of a normal electrical doorbell. Saving energy and batteries at the same time!

Product features

- 16 different ringtones available
- Receiver AC powered
- Includes installation materials
- 100 metre operating range in open field
- LED indication on receiver and transmitter
- Volume adjustable
- Frequency: 433 MHz
