# EcoSavers® Water saving Showerhead

The EcoSavers® Water saving Showerhead is a water- and energy saving product which replaces your existing regular showerhead.

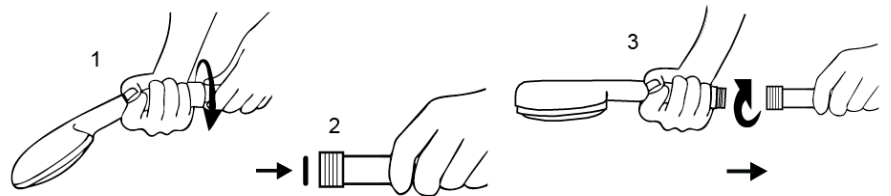

This product uses much less water than a regular showerhead. A regular showerhead provides around 11-12 litres of water per minute. This product uses an average 5-6 litres water per minute, so a big reduction of water use.

You are not only saving water. Heated water costs a lot of energy (oil, gas or electricity) to heat up, so you are also saving lots of energy by using less water.

The water saving showerhead has a 1/2" connection, which is the standard connection size for a shower hose.
